

## 4 7 Inverse Trigonometric Functions Worksheet Day 2 Answers

Recognizing the pretension ways to acquire this books 4 7 inverse trigonometric functions worksheet day 2 answers is additionally useful. You have remained in right site to begin getting this info. get the 4 7 inverse trigonometric functions worksheet day 2 answers join that we give here and check out the link.

You could purchase guide 4 7 inverse trigonometric functions worksheet day 2 answers or get it as soon as feasible. You could speedily download this 4 7 inverse trigonometric functions worksheet day 2 answers after getting deal. So, afterward you require the books swiftly, you can straight get it. It's therefore categorically simple and thus fats, isn't it? You have to favor to in this tone

Recall that we write  $\sin^{-1} x$  or  $\arcsin x$  to mean the inverse  $\sin^{-1}$  of  $x$  restricted to have values between  $-\pi/2$  and  $\pi/2$  (Note that  $\sin x$  does not pass the horizontal line test, hence we need to restrict the domain.) We define the other five inverse trigonometric functions similarly.

On these restricted domains, we can define the inverse trigonometric functions. The inverse sine function  $y = \sin^{-1} x$  means  $x = \sin y$ . The inverse sine function is sometimes called the arcsine function, and notated  $\arcsin x$ .

---

### Inverse Trigonometric Functions | Precalculus

The following examples illustrate the inverse trigonometric functions: Since  $\sin(\pi/6) = 1/2$ , then  $\pi/6 = \sin^{-1}(1/2)$ . Since  $\cos(\pi) = -1$ , then  $\pi = \cos^{-1}(-1)$ . Since  $\tan(\pi/4) = 1$ , then  $\pi/4 = \tan^{-1}(1)$ . To create the inverse functions, we choose a restricted domain for each function that includes the number 0.

### 7.4: Inverse Trigonometric Functions - Mathematics LibreTexts

Notation. Several notations for the inverse trigonometric functions exist. The most common convention is to name inverse trigonometric functions using an arc- prefix:  $\arcsin(x)$ ,  $\arccos(x)$ ,  $\arctan(x)$ , etc. (This convention is used throughout this article.) This notation arises from the following geometric relationships: [citation needed] When measuring in radians, an angle of  $\theta$  radians will ...

---

### Inverse trigonometric functions - Wikipedia

Just as we did with the original trigonometric functions, we can give exact values for the inverse functions when we are using the special angles, specifically  $\pi/6$  (30°),  $\pi/4$  (45°), and  $\pi/3$  (60°), and their reflections into other quadrants.

### 4.7 - Inverse Trigonometric Functions

The inverse trigonometric functions are also called arcus functions or anti trigonometric functions. These are the inverse functions of the trigonometric functions with suitably restricted domains. Specifically, they are the inverse functions of the sine, cosine, tangent, cotangent, secant, and cosecant functions, and are used to obtain an angle from any of the angle's trigonometric ratios.

### 4-7 Inverse Trigonometric Functions

Trigonometric functions¶ Except where otherwise noted, the trigonometric functions take a radian angle as input and the inverse trigonometric functions return radian angles. The ordinary trigonometric functions are single-valued functions defined everywhere in the complex plane (except at the poles of  $\tan$ ,  $\sec$ ,  $\csc$ , and  $\cot$ ).
