• A unit is a standard measure of a physical quantity with a numerical value of exactly one. • For example, the meter is the standard of length in the SI system of units. The SI system is based upon standards for a few fundamental physical quantities, including length, mass, and time. 8

General Physics I Chapter 1: Measurement

Measurements (quantitative observations) are often more useful than qualitative observations. The system of units for measurements in physics is the SI system. The fundamental quantities in the SI system are length, mass, and time. The SI unit for length is the meter, for time is the second, and for mass is the kilogram.

It follows from the definition of t that the degree Celsius is equal in magnitude to the kelvin, which in turn implies that the numerical value of a given temperature difference or temperature interval whose value is expressed in the unit degree Celsius ($^{\circ}\text{C}$) is equal to the numerical value of the same difference or interval when its value is expressed in the unit kelvin (K).
