David A Lass's introduction to angelfish fulfills its subtitle, "Understanding and Keeping Angelfish," and more. This colorful guide in the Fish Keeping Made Easy series discusses angelfish in their natural Amazon rain forest habitat in South America and the needs of this beautiful and recognizable fish in the home aquarium based on their dietary, water conditions, and behavior in the wild. The chapter "Angelfish Groups" describes the three species of angelfish (Pterophyllum altum, P. leopoldi, and P. scalare), the most popular twelve color variations seen in local pet stores, and the special traits of the species. Separate chapters are devoted to selection and care, feeding and diet, and reproduction. The author discusses the keeping of angelfish in an "all-angel" tank (shoal of angelfish!) as well as in a community tank, and gives solid advice on selection of equipment and live plants. A chapter on parasites and diseases will be of great use to all fishkeepers trying to avoid fungal, bacterial, and viral diseases in their tanks as well as general treatment protocols and hospital tanks. Glossary as well as resources of websites and publications conclude the guide.

Possibly the most recognized freshwater fish in the aquarium hobby, angelfish belong to the family Cichlidae. Admired for their graceful swimming behavior, angelfish make stunning additions to large community aquariums. Wild caught angelfish are rare in the aquarium hobby, with most fish for sale being captive raised. Wild angelfish are silver with black vertical stripes, however, through selective breeding, many color patterns as well as long-finned varieties, known as "veiltails", have been developed over the years. Most angelfish sold in the hobby are Pterophyllum scalare, however, P. altum is occasionally available. A third species, P. leopoldi, the smallest and most aggressive species of angelfish, is almost never seen. Angelfish are native to a large area of tropical South America, including much of the Amazon River system. In their natural habitat, they are found almost exclusively in quiet, slow moving water. In the wild they prefer dimly lit areas, under overhanging vegetation or among trees that have fallen into the river. Angelfish grow to be quite large and will require an aquarium of 55 gallons or larger when full grown. Tall aquariums are best, to accommodate their body shape. Water flow should be gentle, and décor should include large broadleaf plants and driftwood that is arranged vertically to simulate downed branches and trees. A few floating plants can also be added to provide shaded areas and cover. Substrate should be fine to medium grade, smooth surfaced gravel, as angelfish like to forage along the bottom for food. Angelfish will feed at the surface or mid-water, however, in nature they often forage along the bottom looking for worms and small crustaceans. They are omnivores and will thrive on Aqueon Tropical Flakes, Color Flakes, Tropical Granules and Shrimp Pellets. Frozen and live foods can also be fed as treats or to help induce spawning. For best results, rotate their diet daily and feed only what they can consume in 2 to 3 minutes, once or twice a day.
