Impulsivity The Behavioral And Neurological

Overview. Overview. Impulsivity explores the basis for the seemingly universal tendency to devalue rewards or punishments that are not immediately available. When confronted with any number of modern impulsive behaviors—such as drug use, pathological gambling, marital infidelity, and gluttony—individuals have a choice with two outcomes: an immediate benefit, such as getting high, or a delayed or probabilistic benefit, such as health, money saved, or the satisfaction of a good life.

Both internal and external stressors are known triggers for impaired impulse control. Many types of impulse control disorders are thought to stem from underlying neurological vulnerabilities coupled with environmental stresses. Some risk factors include: Being male (males are more prone to impulse control disorders than females)

Impulsive Behavior and Impulse Control Disorders

Impulsivity has been consistently linked to several types of addiction, attention deficit/hyperactivity disorder, mania and other psychiatric conditions. Our discussion of the behavioral assessment of impulsivity will focus on objective laboratory tasks of response inhibition that have been implemented in parallel for humans and other species with relatively few qualitative differences.
