The Multi-Agent System (MAS) approach provides a powerful platform for modeling and solving real world problems such as healthcare. This makes it possible for patients to remain at home and consequently reducing costs. This paper presents developed MAS applications in healthcare, as well as explores the future of developed MAS applications.

Multi-agent systems can be considered a suitable technology for the realization of applications for providing e-health services where the use of loosely coupled and heterogeneous components, the dynamic and distributed management of data, and the remote collaboration among users are often the most relevant requirements.

Multi-Agent Systems (MAS) technology is widely used for the development of intelligent distributed systems that manage sensitive data (e.g., ambient assisted living, healthcare, energy trading). To foster accountability and trusted interactions, recent trends advocate the use of blockchain technologies (BCT) for MAS.

A flexible and extensible multi-agent system is designed and connected to the existing monitoring system through the database connection (Smarsly et al., 2011c, d, 2012b). The purpose of the multi-agent system is to self-detect malfunctions and enable corrective actions.

A multi-agent system is a computerized system composed of multiple interacting intelligent agents. Multi-agent systems can solve problems that are difficult or impossible for an individual agent or a monolithic system to solve. Intelligence may include methodic, functional, procedural approaches, algorithmic search or reinforcement learning. Despite considerable overlap, a multi-agent system is not always the same as an agent-based model. The goal of an ABM is to search for explanatory
