In the near future, applications of nanomedicine will involve engineered molecules to develop drugs, drug delivery techniques, diagnostics, medical devices and enhanced gene therapy and tissue engineering procedures.3 Nanomedicine as a Potential Platform for Therapeutic Applications

Applications of Nanomedicine  
Nanomedicine could involve the design of new scaffolds and surfaces for engineering sensors or implantable systems and electronics to aid in the regeneration of tissues (i.e., regenerative medicine). Many of these concepts are still at the early stages of development, but some have already reached clinical practice.

Nanomedicine formulations are primarily designed to improve the biodistribution and the target site accumulation of systemically administered (chemo)therapeutic agents. To facilitate pharmacokinetic and biodistributional analyses, and thereby improve drug targeting to pathological sites, it would be highly useful if the circulation time and the organ accumulation of nanomedicine formulations could be visualized noninvasively in real time.
