As we have observed in the previous discussion, the solutions of the wave equation (1.2) are • given by the formula (2.1), • uniquely determined by u and \dot{u} at the initial time $t=0$.

Consequently, in terms of the functions v , w introduced in (2.1),
 $u(0,x) = u_0(x) = v(x)+w(x)$, .

~~Wave equations, examples and qualitative properties~~

All solutions to the wave equation are superpositions of "left-traveling" and "right-traveling" waves, $f(x+vt)$ and $g(x-vt)$. These are called left-traveling and right-traveling because while the overall shape of the wave remains constant, the wave translates to the left or right in time.

~~Wave equation - Wikipedia~~

So this wave equation should spit out three when I plug in x equals zero. When I plug in x equals one, it should spit out, oh, that's at zero height, so it should give me a y value of zero, and if I were to plug in an x value of 6 meters, it should tell me, oh yeah, that y value is negative three.
