A collection of essays that seeks to undo Willa Cather's longstanding reputation as a writer who remained aloof from the cultural issues of the day.

On a sunny fall afternoon in 1988, Jon Sarkin was playing golf when, without a whisper of warning, his life changed forever. As he bent down to pick up his golf ball, something strange and massive happened inside his head; part of his brain seemed to unhang, to split apart and float away. For an utterly inexplicable reason, a tiny blood vessel, thin as a thread, deep inside the folds of his gray matter had suddenly shifted ever so slightly, rubbing up against his acoustic nerve. Any noise now caused him excruciating pain. After months of seeking treatment to no avail, in desperation Sarkin resorted to radical deep-brain surgery, which seemed to go well until during recovery his brain began to bleed and he suffered a major stroke. When he awoke, he was a different man. Before the stroke, he was a calm, disciplined chiropractor, a happily married husband and father of a newborn son. Now he was transformed into a volatile and wildly exuberant obsessive, seized by a manic desire to create art, devoting virtually all his waking hours to furiously drawing, painting, and writing poems and letters to himself, strangely detached from his wife and child, and unable to return to his normal working life. His sense of self had been shattered, his intellect intact but his way of being drastically altered. His art became a relentless quest for the right words and pictures to unlock the secrets of how to live this strange new life. And what was even stranger was that he remembered his former self. In a beautifully crafted narrative, award-winning journalist and Pulitzer Prize finalist Amy Ellis Nutt interweaves Sarkin's remarkable story with a fascinating tour of the history of and latest findings in neuroscience and evolution that illuminate how the brain produces, from its web of billions of neurons and chaos of liquid electrical pulses, the richness of human experience that makes us who we are. Nutt brings vividly to life pivotal moments of discovery in neuroscience, from the shocking (re)birth of a young girl hanged in 1650 to the first autopsy of an autistic savant's brain, and the extraordinary true stories of people whose personalities and cognitive abilities were dramatically altered by brain trauma, often in shocking ways. Probing recent revelations about the workings of creativity in the brain and the role of art in the evolution of human intelligence, she reveals how Jon Sarkin's obsessive need to create mirrors the earliest function of art in the brain. Introducing major findings about how our sense of self transcends the bounds of our own bodies, she explores how it is that the brain generates an individual (self) and how, if damage to our brains can so alter who we are, we can nonetheless be said to have a soul. For Jon Sarkin, with his personality and sense of self permanently altered, making art became his bridge back to life, a means of reassembling from the shards of his former self a new man who could rejoin his family and fashion a viable life. He is now an acclaimed artist who exhibits at some of the country's most prestigious venues, as well as a devoted husband to his wife, Kim, and father to their three children. At once wrenching and inspiring, this is a story of the remarkable human capacity to overcome the most daunting obstacles and of the extraordinary workings of the human mind.

Karen Osborne continues her science fiction action and adventure series the Memory War with Engines of Oblivion, the sequel to Architects of Memory@the corporations running the galaxy are about to learn not everyone can be bought. Natalie Chan gained her corporate citizenship, but barely survived the battle for Tribulation. Now corporate has big plans for Natalie. Horrible plans. Locked away in Natalie's missing memory is salvation for the last of an alien civilization and the humans they tried to exterminate. The corporation wants total control of both@or their deletion. In the realm of mental phenomena, experiment and measurement have hitherto been chiefly limited in application to sense perception and to the time relations of mental processes. By means of the following investigations we have tried to go a step farther into the workings of the mind and to submit to an experimental and quantitative treatment the manifestations of memory. The term, memory, is to be taken here in its broadest sense, including Learning, Retention, Association and Reproduction. (PsycINFO Database Record (c) 2004 APA, all rights reserved).

Incorporate drama and improvisation into your classroom to build confidence, support social-emotional learning, and engage every student in the curriculum. This book's detailed and easy-to-implement chapters walk you through using drama to develop critical listening and communication skills, conflict resolution abilities, behavior regulation, and even grow new skills in math, literature, geography, and more! Each chapter builds on the skills learned in previous lessons, allowing you to increase the complexity as students progress. Designed for use with inclusive classrooms as well as dedicated special education programs, this guide features adaptable activities to include students at every ability level.

The book introduces readers to the two ways the brain is programmed to learn. It explains how these two systems affect classroom instruction and explains how the events of the culture affect brain development. It also explains how to set up a brain-compatible classroom and the underlying principles that guide all stu- dent learning. The book is loaded with student projects of all kinds that are emo- tionally engaging to students and help them learn more successfully. The book also explains how the emotional part of the brain (the limbic system) many times interferes with learning and prevents reasoning, thinking, and problem-solving to occur preventing students from using the rational parts of the brain (the frontal lobe system) to occur. The book explores how dysfunctional behavior in school such as ADD, & ADHD are related to school skill development and achievement. The argument is made that pre-requisite school success skills that lead to proficiency in reading, writing, calculating, and problem-solving are not really taught but merely assumed to be learned from the home and the early grades. Not only that but these pre-requisite skills are ALL found in the frontal lobe executive functions. The students who have those skills are almost always the high achievers in school. Those students that don't have these school success skills simply don't achieve at the level of the other students who have those skills.
