In the group of patients in whom a cyst was suspected, a much greater proportion opted for surgical treatment than in sulcus; this may be due to the fact that cysts are sometimes associated with an acquired etiology linked to vocal abuse5, 11, 12 and where this is the reason the patient wishes to regain the vocal quality before the development of their symptoms. Furthermore, in our experience, the result of surgical treatment to improve voice quality is better in submucosal cysts than in sulci.

Diagnosis of vocal cord paralysis involves workup via fibronasopharyngolaryngoscopy. Pulmonary function tests and acoustic analysis are adjunctive diagnostic modalities in the management of vocal cord immobility. Unilateral vocal cord immobility is more common than bilateral vocal cord immobility. Treatment of unilateral vocal cord immobility involves restoration of voice quality via several techniques including augmentation, medialization, and reinnervation.
